SHIFAN HIRANI

Dallas, TX | shifan.hirani@gmail.com | linkedin.com/in/shifanhirani | github.com/hirashif | shifan.me

SUMMARY

Backend software engineer who builds and ships production APIs and services across CRM and streaming platforms, from client requirements to keeping services reliable under load. Strongest in Java, Python, JavaScript, and SQL. Targeting backend, full-stack, platform, and fintech roles.

EXPERIENCE

Paycom | Software Engineer II, CRM Team | Irving, TX *Sept 2024 - May 2026*

- Built a Tax Information dashboard in React, backed by PHP and C# services that synced client-system data overnight, cutting the Tax team's research and filing prep ~40% and killing the manual lookups
- Stabilized a long-running data-sync process that hung under tens of thousands of requests/min by chunking the load into smaller batches, restoring reliable throughput
- Built event-driven tasking and notifications across several microservices that auto-updated the assigned client representative when a key contact left a client account, cutting response times ~30%
- Drove new CRM initiatives end to end after the product team was cut: gathered requirements from sales, service, and tax stakeholders, authored the technical specs, and shipped the features
- Onboarded junior engineers onto the CRM codebase and helped them through their first PRs; reviewed team PRs weekly and worked live incident response in Splunk when company-wide CRM services went down

Resi Media | Software Engineer Intern | Allen & Plano, TX *Summers 2022 & 2023*

- Built and optimized backend APIs serving 5,000+ customers, enhancing the RSP-to-RTMP live-streaming pipeline (YouTube, Twitch) and clearing ~20% of the Media team's backlog
- Cut database query times ~25% by adding Redis caching for media metadata; re-engineered the Sites mapping framework (Orika to MapStruct) for ~20% faster transformations
- Reached 85% unit-test coverage (JUnit 5, Mockito) and profiled the streaming API to resolve processing and memory bottlenecks

PROJECTS

Real-Time Crypto Market-Data Pipeline | Go, Kafka, Kubernetes, Azure (AKS) *2026*

github.com/hirashif/crypto-market-pipeline

- Built an event-driven pipeline of three Go services (ingester → processor → REST API) streaming live exchange data over WebSockets into Kafka with Redis caching; runs on Azure AKS (Terraform) with GitHub Actions CI/CD and Prometheus metrics

Double-Entry Ledger Service | Java, Spring Boot, PostgreSQL *2026*

github.com/hirashif/ledger | live demo: ledger-75986543116.us-central1.run.app

- Built a double-entry ledger API in Java and Spring Boot over PostgreSQL: idempotent transfers, accounts locked in ID order against overdrafts and deadlocks, and a reconciliation job; 35 tests (Testcontainers)

Bakeoff | TypeScript, Node.js, Git (open source, MIT) *2026*

github.com/bakeoff-dev/bakeoff | npm: bakeoff-cli

- Built a CLI that races AI coding agents (Claude Code, Codex, Gemini CLI, Cursor) on one GitHub issue, opens a pull request per agent, and scores each on hidden acceptance tests with tamper detection; 372 tests, CI

EDUCATION

Texas A&M University | B.S. Computer Science (Business Concentration) *May 2024*

GPA 3.63 - Distinguished Student (3 semesters) - Capstone with L3Harris: post-quantum crypto library in Go (qs509)
Relevant coursework: Data Structures & Algorithms, Operating Systems, Database Systems, The Bitcoin Protocol

SKILLS

Languages: C++, Python, Java, SQL, JavaScript/TypeScript, PHP, C#, Go
Frameworks & Data: React, Spring Boot, JPA, REST APIs, Kafka, Redis, PostgreSQL, MySQL, JUnit/Mockito
Tools & Infra: Docker, Kubernetes, Azure (AKS), Terraform, CI/CD (GitHub Actions, GitLab), Grafana, Splunk, Jira
AI Tooling: Claude Code, Cursor, Codex, OpenCode (agentic coding), LLM app development (OpenAI API)
Work Authorization: U.S., no sponsorship required
